

# Architecture Specification

Our system is basically two systems. One part being the Alarm and the system that handles all the alarms and the other the modules which is started when the alarm is activated. The alarm part contains a database, notifications and views to show and edit alarms. The module part contains different modules with their own activity, model and controller.

## Database structure:

### Alarm:

- \_id int (key)
- time text
- daysofweek integer
- enabled boolean
- module text
- volume int

## System Des
